Four Stroke Breather Kit

For the KLX 250 and 300

The pressure built in a four stroke motor needs to be vented to an atmosphere by installing our kit. There are power gains, and it will also help in starting after a stall or crash

1. From Engine to Air boot, disconnect standard hose
2. Using aluminum, plug in the air boot
3. Using new hose, run it up near left rear corner of carb, above the shock body and into the air box, behind air filter

Note: Four Stroke Works recommend leaving the air box lid off completely
